Sampling

Sampling Procedure

The sampling frame consisted of a master sample of enumeration areas (EAs) selected from the Population Housing and Establishment Census 2007. The master sample consists of area units of relatively equal size (number of households, about 150 housing units), and these units have been used as primary sampling units (PSUs).

Sample Size

The sample size 7,500 households located in 300 enumeration areas in the Palestinian Territory, distributed by 5000 households in West Bank and 2500 in Gaza Strip. The design considered dissemination on governorate level and the localities affected by the annexation wall.

Sample design

The sample is two stage stratified cluster sample with two stages:

First stage: selection a stratified systematic random sample of 300 Enumeration Areas (200 in west Bank, 100 in Gaza strip).

Second stage: selection a systematic random sample of 25 households from each enumeration area selected in the first stage. And then to choose a legible person aged 18 years and above to be the respondent of the questionnaire questions.

Note: in Jerusalem Governorate (J1), 20 enumeration areas were selected; then in the second phase, a group of 25 households from each enumeration area were chosen using census-2007 method of delineation and enumeration. This method was adopted to ensure household response is to the maximum to comply with the percentage of non-response as set in the sample design.

Response Rate

Response rate was 92%

Weighting

Sample Design Weight was calculated and adjusted after data collection to reflect the population Size

Supervision

Special forms were designed for following up on receiving and handing questionnaires at all levels and to follow up on the daily achievements of the interviewers. The supervisors distributed work on the team using a map and sample guiding list. Daily and weekly reports were produced and handed to the fieldwork coordinator and the project administration explaining the number of completed interviews, non-response cases, and the cases when households could not be contacted after three visits. Moreover, technical staff and fieldwork coordinators conducted field visits to monitor fieldwork and ensure data quality as well as to help with solving problems facing the fieldwork team.

Data Processing

Data Editing

Both data entry and tabulation were completed by using the ACCESS and SPSS software programs. Data entry was organized into two files, corresponding to the main parts of the questionnaire. Data entry template was designed to reflect an exact image of the questionnaire, and included various electronic checks: logical check, range checks, consistency checks and cross-validation.

Data Appraisal

Estimates of Sampling Error

Statistical Errors:

Sampling rather than comprehensive enumeration has been used to collect data in this survey. Therefore it is liable to two types of errors affecting the quality of survey data, sampling (statistical errors) and non-sampling errors (non-statistical errors). Statistical errors mean the errors resulting from sample designing and this is computed simply. Variance and effect of sample design has been computed for the Palestinian Territory, the West Bank and Gaza Strip.

Non-Statistical Errors:

Non-statistical errors, on the other hand, could not be determined easily, due to the diversity of sources from which they may arise, e.g., the interviewer, respondent, editor, coder, and data entry operator.
